

ABSTRACT

Using parental controls includes storing parental control information on a user device and receiving a request from the user device to access a destination over a communications network. Parental control information stored on the user device may be used to determine whether to grant the request from the user device. When the parental control information indicates that the request should be allowed, the user device allows access to the destination. When the parental control information indicates that the request should be denied, the user device denies access to the destination. Information that is related to the parental control information stored on the user device may be stored on a remote device. The parental control information stored on the user device may be verified using the information stored on the remote device.
